

Why low success rates are not necessarily a bad thing...

A different look at Horizon 2020

EARMA Annual Conference

Lulea, 22 June 2016

Dr. Peter Fisch

mail@peter-fisch.eu

Intro

- Personal background
 - Over 20 years in DG RTD
 - Head of Unit
 - „Social sciences and humanities“ (2000 – 2007)
 - „Evaluation and monitoring“ (2007 – 2014)
 - Retired since 2014
 - Publishing analytical comments on peter-fisch.eu
- The content of this presentation does not reflect the official opinion of the European Union. Responsibility for the views expressed therein lies entirely with the author ...

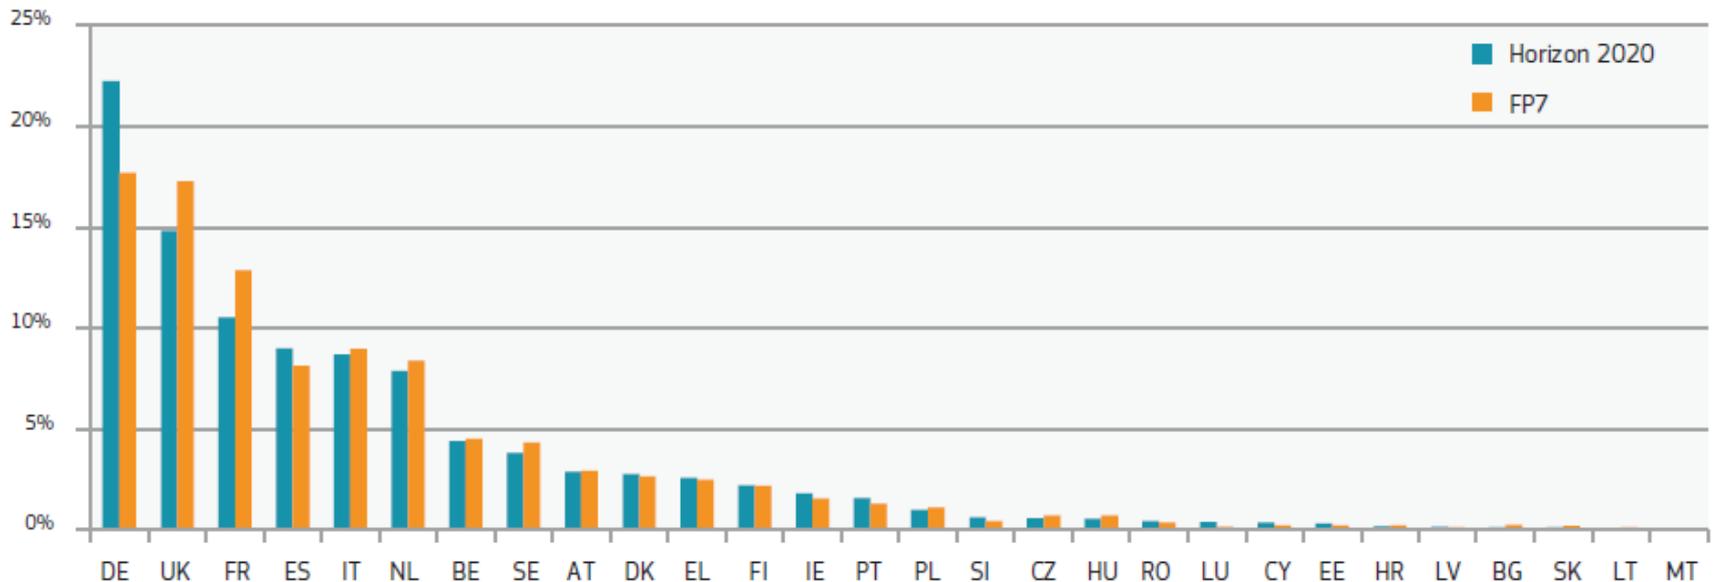

Overview

A different look at

- **Horizon 2020 Statistics**
- **Low Success Rates**
- **FP Governance**
- **Work Programme**
- **Research and Innovation**

Horizon 2020 Statistics

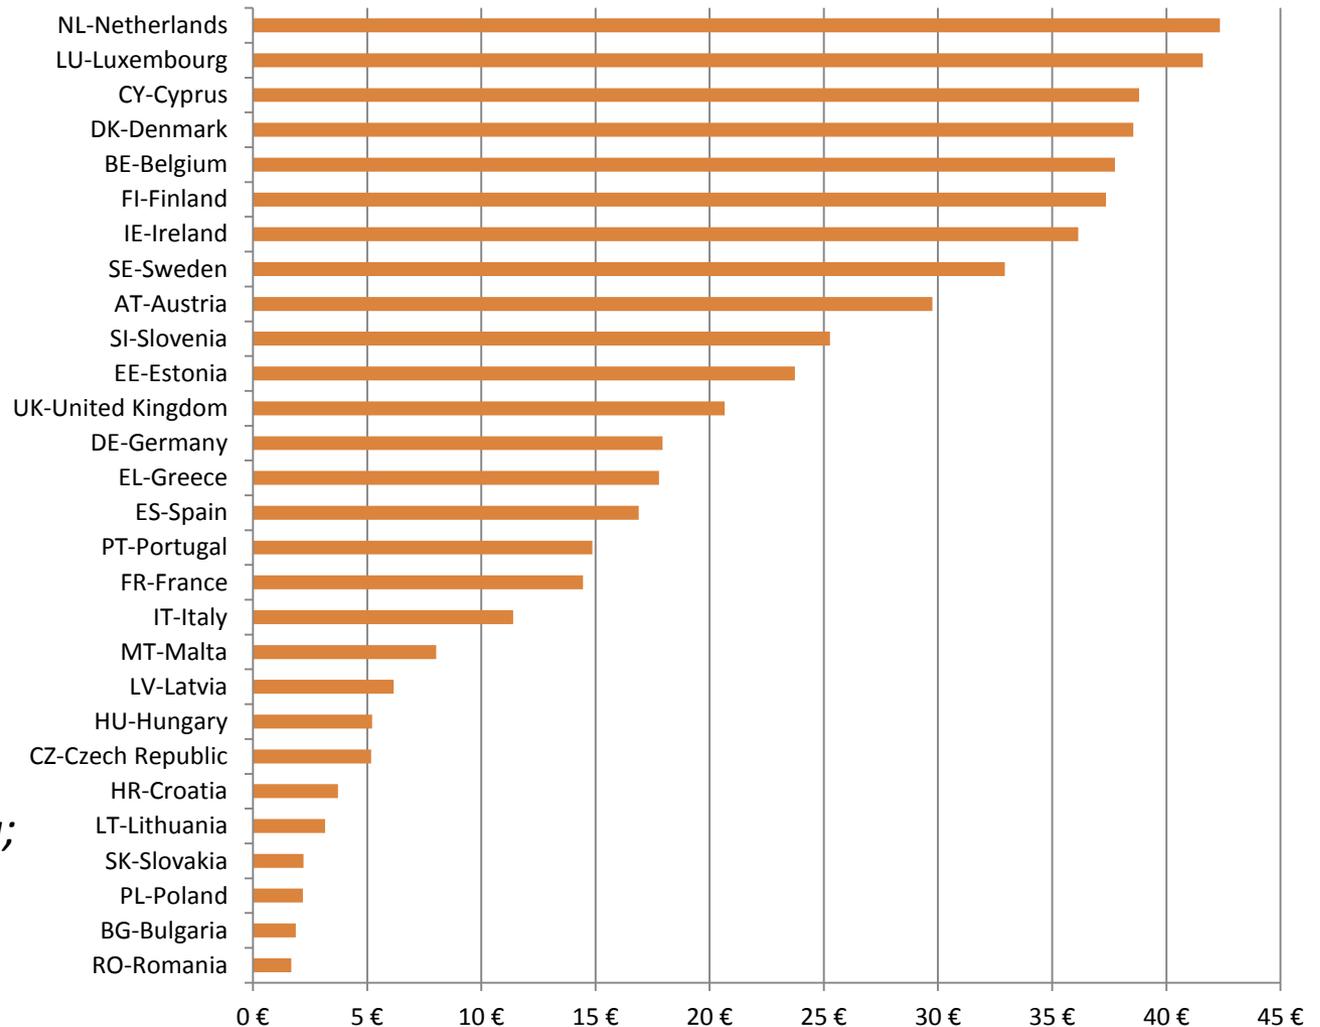

The well known picture

Source: DG RTD

Horizon 2020 Statistics

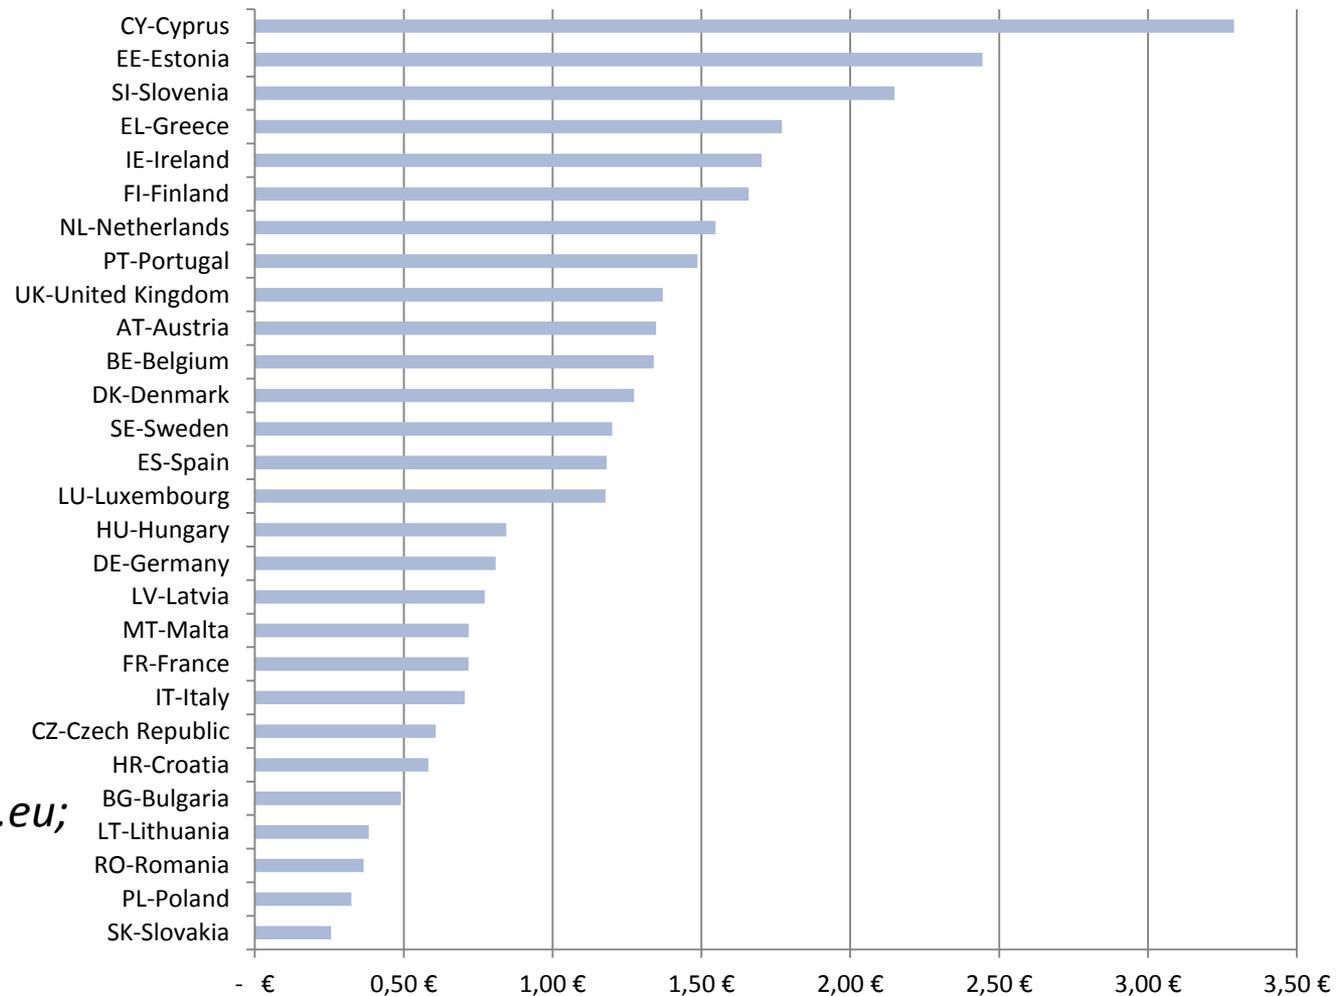

Return per capita

Horizon 2020 Statistics

Illustrating inequalities

Sources:
Open-data.europa.eu;
ERC FP7 Report;
Own calculations

Horizon 2020 Statistics

A different look...

- Not the primary objective of Horizon 2020, but ...
Horizon 2020 leads to a massive monetary redistribution between Member States
- Winners and losers are not necessarily the usual suspects...
- „Small“ countries do relatively better than the „big“ ones ...
- No indication for a trend towards reduced inequalities ...
- Conflicting interests („excellence“ vs. „wider participation“)

Low success rates

The basics

- Average success rate in FP7: 20%
- Average success rate in Horizon 2020: 14%

Low success rates

A disaster?

- Applicants do not like low success rates ...

But:

- Ultimate objective of Horizon 2020 is not:
make applicants happy and keep them in their „comfort zone“
- Aim of Horizon 2020 is a positive impact on the development of European society and economy
- Public perception is very much focused on the worries of applicants, rather than on the interests of future generations

Low success rates Competition?!

- Lower success rates are an indicator for a higher level of competition ...
- ... which is positive from the perspective of programme efficiency
- Extreme case: „Calls with named beneficiaries“
Success rate 100% - but no competition
- Success rate of 14% still relatively high compared with other competitive environments ...

Low success rates

A different look ...

- Lower success rates are to a considerable extent the logical consequence of successful simplification...
- Higher success rates can only be reached through
 - Higher budget (Forget it!)
 - Even more thematic restrictions (Please, no!)
 - More bureaucratic hurdles (Oh my god!)
- Cosmetic measures (two-stages evaluation) are no solution to the mismatch between demand for FP funding and available budget
- Low success rates might actually be the lesser evil...

FP Governance

Complex structures

- Why is there no „Horizon 2020 organigramme“?
- Horizon 2020 structure is extremely fragmented
 - Several Commission DGs and Agencies involved
 - Steadily growing number of specific organisational set-ups with varying partners and specific rules (PPP, P2P, JTI, EIT, COST, ...)
- Incredible amount of micro-management activities, but who takes care at the macro level in terms of
 - Implementation?
 - Political responsibility?
 - Efficient control?

FP Governance

„Golden“ Principles

- Different governance styles in different parts of Horizon 2020
- Anything goes?
- Need for a collective effort to define fundamental principles, e.g.
 - Handling of potential conflicts of interests
 - Guarantee an independent evaluation process
 - Steady renewal of key people in programme management
 - ...
- „Golden“ principles could become a benchmark for national programmes in terms of „good governance“

FP Governance

Bureaucracy vs. Competition

- FPs are situated at the border line between
 - Bureaucracy to specify funding modalities
 - Competition for the best proposals
- Despite “Simplification”, bureaucracy is gaining ground:
 - Selection of topics ...
 - Coordination ...
 - Minimum requirements (TRLs, ...)
 - Ring-fenced budgets (JTI, PPP, ...)
- Growing density of bureaucratic restrictions supported by Member States, Industry, Science organisations ...
- Who is still defending open and free competition?

FP Governance

A different look...

- „Simplification“ campaign so far narrowly focussed on project applications and project management
- „Simplification“ might also be needed in terms of FP structure and governance
- Decentralised structures do not allow for a comprehensive overall management – and an effective control
- Growing part of FP budget reserved for pre-defined activities
- Some flagship activities hide the fact that free competition is losing ground
- And everybody seems to be happy ...

Work Programmes

Central Role in Horizon 2020

- Central steering tool for Horizon 2020
- Official objective: Strategic priority setting
- De-facto objective: Stable success rates
- Drafting of Work Programmes is a lengthy and not very transparent process involving a great number of actors
- Horizon 2020 Work Programmes for 2016: 1800 pages (!)
- Final call texts do not necessarily convince applicants by their clarity and stringency
- Open competition between applications partially replaced by a (hidden) competition to get topics included in the Work Programme

Work Programmes

And if we get rid of these?

- “Strategic” top-down steering of topics
to be replaced by bottom-up applications (like for the ERC)
- Ex-ante rationing through a limited number of „open“ topics
to be replaced by open competition

- Lower success rates (at least in the short run)
- + “Simplification 2.0”
- + Transparency instead of Lobbying
- + Chance for truly innovative applications

Work Programmes

A different look...

- Serious doubts whether Work Programmes fulfil their role as „strategic“ documents ...
- Steady trend to shift the „real“ competition from the proposal stage towards the stage of drafting Work Programmes
- If this is the price to pay for stable success rates – is it really worth it?

- And if the next FP would simply
 - ... support very good research?
 - ... allow researchers to realise their best ideas?

Research and Innovation

Different worlds

- Closer links between research and innovation are useful

But:

- Research and Innovation are different – in terms of objectives, governance, major players, selection criteria, time horizons, arguments for public intervention...
- Innovation is a very broad concept – and only a small part of innovation is based on science or engineering ...

Research and Innovation

The „applicability“ mantra

- Horizon 2020 calls for explicit applicability of research findings
- Projects expected to deliver contributions to overcome the current economic crisis and to generate new jobs

But:

- Implementation of research results into innovative products and new processes takes decades rather than years
- A short term impact of Horizon 2020 on growth and employment in Europe is very unlikely
- Focus on product innovation puts the support to basic innovation at risk – but only excellent basic research will safeguard future growth and employment

Research and Innovation

A different look ...

- Innovation discourse is dominating the political debate in Brussels (and probably elsewhere...)
- Research is increasingly perceived as a tool to implement the innovation agenda (TRL...)
- New initiatives for an Innovation policy at EU level (European Innovation Council) will – one way or another – require massive public funding
- Most likely outcome under the current circumstances: More funding for innovation – less funding on research...
- It's time for a wake-up call...

Outlook

- Basic mechanisms of Framework Programmes are essentially stable since more than 20 years
- 2016 and 2017 are a classic „window of opportunity“ for a critical analysis and new ideas
- Negotiations on the next Framework Programme could become a bumpy ride (Budget, Wider Participation, Innovation...)
- If more innovation is wanted:
 - Don't force innovation aspects into every research project
 - Make sure the overall FP process supports innovative ideas

Thanks
